

WineManager

Important quickstart information

WineManager contains an embedded database of appellations. Each appellation is linked to a specific vintage chart and food pairing information. **WineManager** doesn't provide a wine database like other applications: all needed information is based on this appellation.

With more than 1800 classified appellations and 200 vintage charts, **WineManager** is able to provide information in virtually any situation: this makes a big difference with usual wine databases, obviously limited.

Because all information is linked to a known appellation, the only drawback is to correctly specify an appellation to get the proper values from the embedded database.

Selecting an appellation in a list containing 1800 entries would not be convenient, to help you select an appellation **WineManager** provides an autofill feature: select your appellation letter by letter and **WineManager** will show you all known appellations.

Some appellations are not always normalized on bottles: for example you can find wines with "Fronton" instead of the real "Côtes du Frontonnais" appellation. You may also misspell your appellation.

To help you find or fix your appellation, **WineManager** makes use of a proprietary fuzzy logic algorithm and tries to find the best matching appellations. This is a very powerful but complex feature: you might limit the length of your text when possible.

Most French appellations don't specify varietal names, however this notion is very important with some appellations. **WineManager** can make the difference between varietals, for Australia, Chile, Argentina, California, Oregon...

For example you can add varietal names to "Napa Valley California": "Cabernet-Sauvignon Napa Valley California", "Chardonnay Napa Valley California", "Pinot noir Napa Valley California", "Syrah Napa Valley California", "Zinfandel Napa Valley California".

Last but not least, you can use the fuzzy logic search to find quickly an appellation. For example, you can enter "brdx" and **WineManager** will find possible appellations like "Bordeaux": tap on a line to select your appellation.

You can try to use small parts of the words: "casa" is perfect to find "Cabernet-Sauvignon" and "cbsvnpvl" will match efficiently "Cabernet-Sauvignon Napa Valley California".

Chapter 0 / General information

- What is WineManager?
- How to register WineManager?

Chapter 1 / WineManager main features (1/2)

- Creating a new entry from the cellar list
- Using vintage charts to select wines
- Selecting a wine from your cellar
- Suggesting a wine at the restaurant
- Changing the font size on HiRez devices
- Closable dynamic input area (DIA)

Chapter 2 / WineManager main features (2/2)

- Varietals used in a wine
- Advanced wine information
- Sorting your cellar content
- Filtering your cellar content
- Cellar analysis and suggestions
- Advanced vintage chart information

Chapter 3 / WineManager advanced features

- Changing default food pairings
- Tasting notes and rating
- Global find feature
- Storing the database on memory cards
- Moving WineManager to a memory cards
- Sending the cellar database
- Exporting a cellar view in csv format

Chapter 6 / WineManager version history**Chapter 0 / General information****WineManager key features:**

- manage your cellar with all needed information
- food pairing advisor: select wines from your cellar
- advanced vintage charts sorted by appellations
- cellar analysis and suggested purchases list
- database and application usable from memory card
- tasting assistant: aromas and flavors selection

What is WineManager?

WineManager is a new generation pocket cellar assistant. **WineManager** is the solution to help buying wines, track your cellar content, and select the proper wine from your cellar for your meal.

Vintage charts can be useful, but you need to know appellations to use vintage charts: where are "Chablis" or "Collioure" coming from? If you don't know, your vintage chart won't help you. **WineManager** will find the proper vintage chart depending on the selected appellation.

Many tools will let you know which wine you should buy for your meal, but if you already have some bottles it won't help. **WineManager** will go further and will suggest a list of wine from your own cellar.

HiRez color

LoRez color

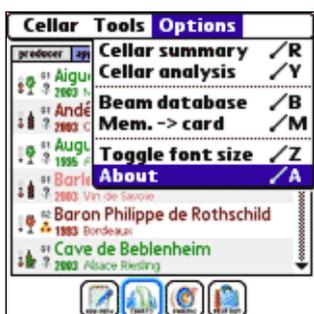

LoRez grayscale

How to register WineManager?

You can try **WineManager** during a trial period. After this trial period, features are restricted and you need to register to remove limitations. Please support shareware applications!

Chapter 1 / WineManager main features (1/2)

Most **WineManager** features are based on appellations. Once you have created an entry with the proper appellation, **WineManager** will be able to match this entry against vintage charts, or food pairings.

Always ensure you have selected the proper appellation from **WineManager** appellations list, and don't forget to configure both year and color of your wine.

Creating a new entry from the cellar list

This step-by-step example will show you how to create a new entry. At first, your cellar is empty: you don't have any item on the main screen. You should press the "Add new" button to record a new entry in your cellar.

Ensure you have defined a known appellation, year, color and quantity of your new entry, and then press the "Save" button to return to the main cellar screen. If your device is a **Treo 600, Treo 650, Treo 680, Treo 700p, Zire 71** or **Zire 72**, you can add a photo or scan a barcode attached to your entry. Note: barcode support for **Zire 71** and **Zire 72** requires **Barcode/13** release 1.0.2.

You can create an entry with the status "On order": select the caddy icon to set/unset this flag. When the flag is set, the caddy will be show in the main list for this wine: the number of bottles will be used to calculate the cellar summary and to suggest new wines, but **WineManager** won't use this entry to suggest a wine for your meal. Unset the caddy icon to activate your wine when it will be available in your cellar.

You will fill the year field most of the time, however you can create a "non-vintage" entry: leave the field empty to do so. If your entry matches a known appellation, **WineManager** will use the younger vintage in the chart to rate this wine: this makes sense for quality table wines.

WineManager can keep a trace of the total quantity of bottles purchased: this value is shown next to the quantity value. This value can be changed automatically or manually:

- **Automatically:** Use VolumeUp key to add a new bottle, it will increase both current quantity and total quantity. To remove a bottle from your cellar, you may use VolumeDown key which keep the total quantity untouched.
- **Manually #1:** Shift+NavUp and Shift+NavDown will change only the total quantity.
- **Manually #2:** While editing the current quantity, + and - will change the total quantity.

Using vintage charts to select wines

Always remember a wine vintage chart cannot sum up the qualities of wines. It is convenient only as a rough estimate of vintages reputations and of when to hold and when to drink the wines: vintage charts can hide exceptional wines within poor vintages and occasionally the reverse. You don't have to know the region of your wine to get a vintage chart: enter a known appellation and **WineManager** will select the proper vintage chart. Yellow year/color is used to suggest wines that might improve your current cellar, depending on food pairings and vintage values.

You can use the "Add new" button to create a new entry autofilled with this appellation. You can also select the proper year/color from the vintage chart table to create a new entry. Vintage charts and appellations list are updated frequently, you can contact your support to suggest a missing appellation. With more than 200 regions and 1800 classified appellations, **WineManager** is probably the most comprehensive chart.

- superlative
- classic excellent very good
- good acceptable avoid
- "hold"
- "early": can drink, not yet at peak
- "drink": ready, at drink maturity
- "late": can drink, maybe past peak
- "past": in decline, maybe undrinkable

PageUp and PageDown (or NavUp and NavDown) can be used to scroll appellations up and down. On **Treo 600**, **Treo 650**, **Treo 680** and **Treo 700p** devices, you can press Shift+NavUp and Shift+NavDown to scroll page by page. Appellations may also be selected using your stylus.

Selecting a wine from your cellar

Which wine should you select for your meal? 15 categories are available and you can select more than one to describe your meal. For example if you have pork tendorins with tomato sauce, you might select "Pork" and "Tomato". You can select "Poultry" and "Venison" to find a perfect wine for birds.

Depending on your choices, "Results" will return to the cellar list. The cellar view will be sorted to show suggested wines for your meal. Best matching wines are on top of the list, again this is a rough selection and should only be used to help your choice.

If you don't already have the perfect wine in your cellar, or need a suggestion for a better one, select the "Best buy" option. **WineManager** will analyze your cellar for the selected meals only and will suggest the best matching wines. Please read "Cellar analysis and suggestions", chapter 2, to learn more about this feature.

Suggesting a wine at the restaurant

Chapter 2 will show how to improve your

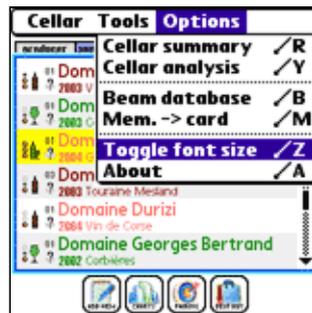

cellar with the cellar analysis feature. However, you might need a suggestion to find the best wine from a menu for your meal right now. Open the cellar analysis menu and select "to drink now", tap on icons to describe your meal and **WineManager** will suggest wine regions.

If you are unsure about appellations from a region, you may tap on this region to open a pop-up with a list of appellations associated to this region.

To learn more about the cellar analysis feature, please read "Cellar analysis and suggestions", chapter 2.

Changing the font size on HiRez devices

WineManager is optimized for both LoRez and HiRez devices and will adjust the display to take advantage of your device resolution. However, if you want to use bigger fonts, please select "Options > Toggle font size" (this features is only available on HiRez devices).

Chapter 2 / WineManager main features (2/2)

Varietals used in a wine

To classify California wine by producer, color and appellation is not sufficient, varietal name is critical here. The same producer in the same appellation might produce a Zinfandel and a Cabernet-Sauvignon. Specific appellations are available in **WineManager** with grape varieties, mostly for wines from California, Oregon and Australia.

Napa Valley in Napa County North Coast California

Normal appellation would be:

- Napa Valley California

But you can detail a varietal name:

- Cabernet-Sauvignon Napa Valley California
- Chardonnay Napa Valley California
- Pinot noir Napa Valley California
- Syrah Napa Valley California
- Zinfandel Napa Valley California

Depending on grape varieties, wines will age differently and **WineManager** will use different vintage charts.

Los Carneros in Napa County North Coast California

You can select the following appellations:

- Los Carneros California
- Cabernet-Sauvignon Los Carneros California
- Chardonnay Los Carneros California
- Pinot noir Los Carneros California

You won't find Syrah or Zinfandel because **WineManager** doesn't have relevant specific data for Los Carneros, however some appellations may apply if your wine is in Zinfandel varietal:

- Zinfandel Napa County California
- Zinfandel North Coast California
- Zinfandel California

Of course, "Zinfandel Napa County California" is the best choice in this example.

Advanced wine information

Different fields are available, from top to bottom:

- Buying price
- Date of purchase
- Tasting mark (0 to 3 stars)
- Bottle volume (cl)
- Barcode (ean-13 format)
- Other notes

Volume is mandatory for cellar analysis, barcode will help you find an entry with the search icon. You can add information in your notes, you can also enter keywords. Keywords are useful with sorting features from the main cellar view. Only first characters from the note will be used with sorting features, allowing up to 4 keywords.

Sorting your cellar content

You can sort your cellar list by producer name, appellation, vintage, quantity or color. On **Treo 600**, **Treo 650**, **Treo 680** and **Treo 700p** devices, you can press Shift+NavRight and Shift+NavLeft. + and - can be used to increase/decrease the quantity of the selected wine. Items with quantity set to 0 are hidden: you can select "Show unavailable" in menus to make them available.

If your device doesn't support 5 ways navigation, PageUp and PageDown will scroll the list.

If your device supports 5 ways navigation, you should use NavRight to move from the cellar list: NavUp and NavDown will scroll the list. Shift+NavUp and Shift+NavDown are also available on **Treo 600**, **Treo 650**, **Treo 680** and **Treo 700p**.

Filtering your cellar content

Your current cellar view can be filtered with a keyword. You can enter up to 8 letters to filter your view, **WineManager** will search matching items for producers, appellations and notes. Matching words are only prefixes: for example "rho" will match "Rhône" in appellations.

Keyword searching in notes is limited to the beginning of notes. Current limit is 30 characters to avoid slowdown, please contact your support if you think it could be useful to increase this value.

Filtering can work with sorting options and after food pairing. It can be an easy way to

extract a specified part of a search result with specific keywords

Cellar analysis and suggestions

WineManager can analyze your cellar using food pairing tables and vintage charts. Cellar analysis will report your current cellar status: 100% in a category requires 4 bottles of 75cl of the best matching wine from a perfect vintage. You shouldn't expect such a score: in fact 75% is a very good, and 50% is not that bad. Most of the time, getting a higher score will require more expensive and aged wines. Default value is 4 bottles, you can modify this parameter for your needs: if you plan to hold wines in your cellar, you might select a higher value according to your cellar capacity. Pairing types can be selected (green check) or unselected (red cross) if you need **WineManager** to suggest wines for certain types of meal: when a category is unselected, **WineManager** won't suggest wines to improve this category.

On the second part of the screen, **WineManager** suggests some regions that could improve your cellar. First value is how much you could improve your cellar with a wine from this region, second value is a suggested vintage. Obviously, this vintage will depend on the chosen appellation from this region. On high resolution devices, you can click on a region to get a list of appellations for this region. You can use + or - to get younger or older wines, depending on your device you can also use PageUp, PageDown, VolumeUp, VolumeDown.

You can export suggested regions to your MemoPad using "Copy to memo" in menus. This list can also be sent as a plain text, through a bluetooth connection to a computer for example, using "Export to .txt" in menus.

Done Details

Advanced vintage chart information

As stated above, you can improve your cellar with specific wines. WineManager will analyze your cellar in background to suggest vintage in you vintage charts.

On high resolution devices, advanced information are available. On the right part of the screen, icons qualify food pairings for this appellation. First column is for red wines, second is for white wines. This default values can be changed when a new entry is added.

On the left bottom part of the screen, you will get tasting information for some wines: this feature is mostly available for French wines currently.

Chapter 3 / WineManager advanced features

Changing default food pairings

WineManager uses its own pairing tables to suggest wines, but if you know exactly the best matching meals for your wine, you might want to configure this directly. To do so, when editing your wine, select the second tab "Pairing". All values should be set to "A" (automatic), but you can move each value and set the pairing value from "0" (don't match) to "3" (perfect match).

If you are unsure about this feature, you should really keep default values. If you think there is an error, you might consider contacting your support instead. **WineManager** will be updated frequently: pairings and charts will be updated in the same time automatically with updated values.

Tasting notes and rating

WineManager provides a specific "Rating" tab for wine connoisseurs. Four elements are directly available: vintage rating, ageing potential, flavors and aromas. This tab will let you efficiently note elements about a wine during a tasting session.

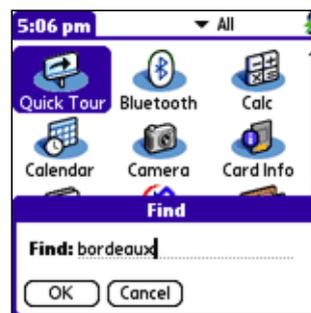

Vintage rating and ageing potential will overwrite **WineManager** default values for a specific wine. Rating can be set to "auto" or from 0 to 7: 0 is equivalent to 80/100 or less, 7 is equivalent to 98/100 or more. Ageing potential lets you specify how many years from the vintage will elapse for specified step: for example in 2003+1 it will be early but drinkable, perfect in 2003+2, getting old in 2003+4 and maybe undrinkable in 2003+5. **WineManager** vintage charts are updated frequently, you may not change default behaviors unless you are sure!

Flavor profile consists of a three digit number characterizing each wine and indicating a wine's balance based on three complementary sensations: the organoleptic profile of a wine. Power describes its aromas and length of its finish, body is its consistency in the mouth, tannins the resulting astringency for red wines, and finally the residual sugar levels for white wines and rosés.

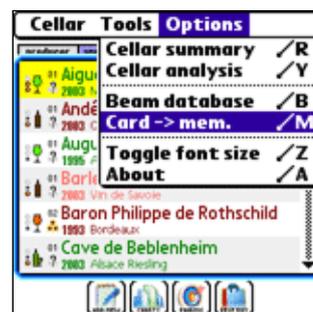

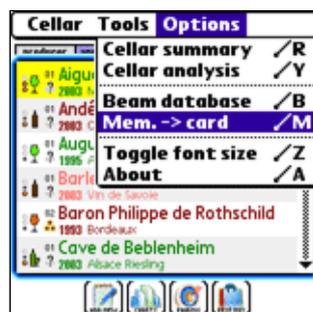

Global find feature

Standard global find feature is supported by **WineManager** and can be used to find a wine, using an appellation or a producer name. Tapping on the found entries will open the selected entry in **WineManager**.

Storing the database on memory cards

You can move your database to a memory card. However, your database will be moved at launch time and **WineManager** start/exit will take several seconds in this case.

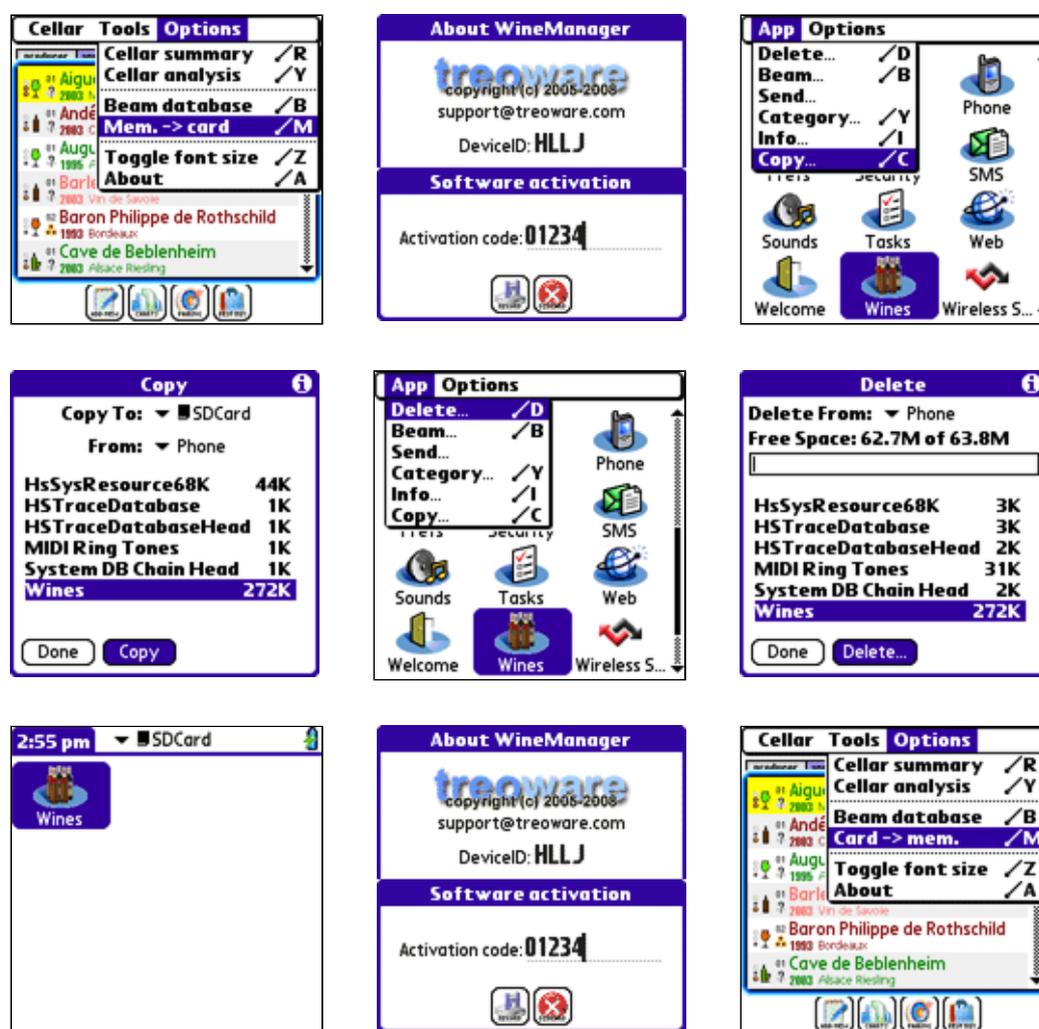

Moving WineManager to a memory cards

WineManager can be run from a memory card. To avoid data loss, be sure to follow these steps:

1. Move your database to your memory card from **WineManager** menu
2. Open the registration menu "Options > About" to retrieve your registration key
3. From the applications launcher, copy **WineManager** to your memory card
4. From the applications launcher, delete **WineManager** from the main memory
5. Now you can find and run **WineManager** from your memory card
6. Restore your registration key in "Options > About"
7. Not mandatory: you can move your database back to the main memory

Be sure you have moved your database to your memory card and read your registration key: when deleting **WineManager** from the main memory **all attached data** will be destroyed, including your database and your registration key. Moving your database to your memory card **before** deleting the application will avoid this loss.

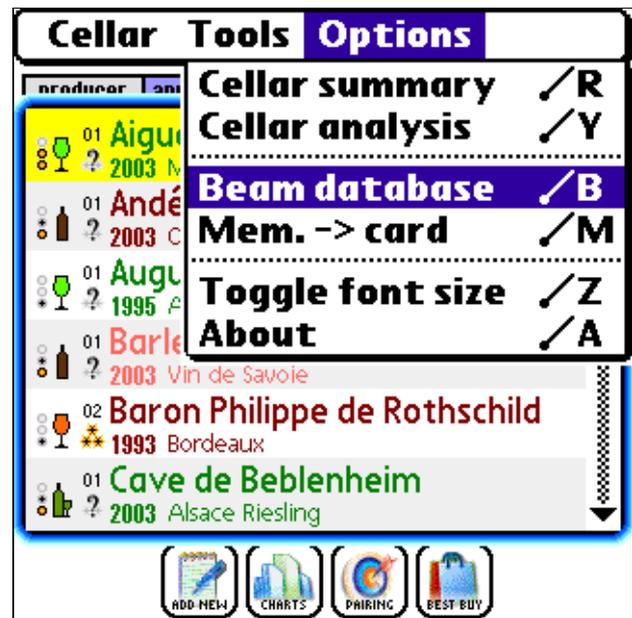

Sending the cellar database

You can send your complete database to a remote computer or to another PalmOS device with bluetooth or infrared. When sent to a computer, the file is named WineManagerDB.pdb and is a standard PalmOS

database.

Unregistered versions of **WineManager** can receive a remote database and use it with some restrictions. This feature gives the ability to share your database content with your partner: you don't need a second registration key for this second device, and updated database can be sent very easily to this device directly from **WineManager**. Photos attached to an entry can be viewed on the remote device even if no camera is available. If `JpegLib.prc/pnoJpegLib.prc` is used on the main device, it must be installed on the remote device to view compressed images.

Exporting a cellar view in csv format

You can sort your database, filter your database with keywords, or select wines with food pairing. **WineManager** can export your current view to a remote device, for example using bluetooth or infrared. Two formats are available: XML format and CSV format. XML file can be opened with a compatible browser, CSV file can be imported for example in Excel.

Please note: current file format may change in new releases to improve exports, if you plan to write an application using these files, please contact your support.

Chapter 4 / WineManager plugins compatibility

Scanning barcodes with Barcode/13

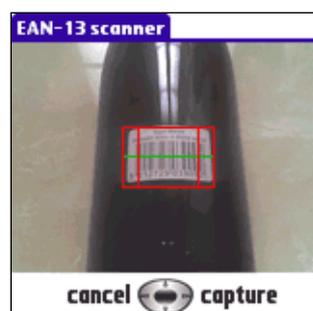

WineManager is fully compatible with **Barcode/13** to scan a barcode from a wine bottle. This barcode must be EAN-13 format (13 digits): if your wine carries a UPC-A barcode (12 digits) you must add a leading "0" digit.

From the main cellar view, your can launch **Barcode/13** with the Enter key from the keyboard: if you scan a barcode already known in your cellar database, the proper entry will be opened.

From the new entry view you can scan a barcode or set it manually. When a barcode is set, you can use the lookup button to search an entry in your database.

Internal "Barcode helper"

Optionnal Barcode/13

Storing jpeg images with JpegLib or pnoJpegLib

A photo can be attached to a wine description with supported devices: **Treo 600, Treo 650, Treo 680, Treo 700p, Zire 71 and Zire 72**. This picture is in raw format, taking a large amount of memory: you might install `JpegLib.prc` or `pnoJpegLib.prc` to add JPEG support to **WineManager**. **JpegLib** and **pnoJpegLib** (optimized for ARM devices) are free, easy to install, and very small: `JpegLib.prc/pnoJpegLib.prc` are distributed with **WineManager** and can be downloaded from the following address:

Older 68000 devices **JpegLib** <http://www.nyctergatis.com/jpeglib/index.html>

Recent ARM devices **pnoJpegLib** <http://www.bin-people.de/pnoJpegLib/index.html>

Once installed, photo will be saved in JPEG format: if you beam your database to another device you might install **JpegLib** or **pnoJpegLib** on this device to see this picture.

Chapter 5 / WineManager compatibility list

Palm Powered Solution (tm)

WineManager is compliant with Palm Powered Solutions Test Application Compliance Testing Version 2.0.

The Palm Powered Solution mark identifies software that has passed testing to ensure its compatibility with the Palm OS platform: It reassures customers that third-party software products will run on their Palm Powered devices (for both 68k or ARM based devices). Anywhere in the world, in all languages, Palm OS users will be able to look for the Palm Powered Solution mark to help them match Palm OS compatible software with Palm Powered devices. The Palm Powered Solution mark indicates platform compatibility with Palm OS- that is, that the application has been tested to be compatible with, and will run on all versions of Palm OS (including Palm OS Cobalt, if the marketing material indicates Palm OS Cobalt compatibility).

Use of the Palm Powered Solution mark indicates that the application will run on devices that have the Palm OS inside and will be forward compatible with the latest versions of the Palm OS.

The use of the "Palm Powered Solution" mark is not an endorsement from PalmSource. It does indicate certain characteristics and attributes of an application that have been positively tested by the developer. It does not imply the application supports other features of the platform such as high-resolution screen sizes and/or color.

Special testing notes:

- SCREEN-02 240x320 16 bit: graphics are not optimized but result is usable
- SCREEN-03 Other Resolutions: 1 bit graphics are not optimized but result is usable
- SCREEN-04 Dynamic input area: N/A
- UI-03 Modal dialogs: default button is always "Cancel"
- STRESS-01 Gremlins on Palm OS Simulator: 4.1.2 & 5.4, JpegLib installed, with/without an existing database
- STRESS-02 Low memory condition: fails gracefully as expected before the test can finish
- SYS-01 Mask/Unmask records: N/A
- SYS-07 Application deletion: database, when installed on memory card, is not deleted
- COBALT-01 Palm OS Cobalt Simulator: application works correctly
- PH-04 No data connection test: N/A

- PH-05 Additional Stress test: Treo 180, Treo 600, Treo 650, Treo 680

5 way navigator, jog, volume and keyboard

WineManager is optimized to detect and use entry methods for most peripherals. Up to 3 levels (attached to 3 different actions) can be available and associated to available buttons. Configuration is summarized in the following table. When a key pressed is not handled, it is used as a lower level: for example "up #3" will act the same as "up #1" if "up #3" and "up #2" are not relevant in a form.

Special keys	Single key	Shift+Key	Option+Key
5-way up	Move focus up ⁽¹⁾	Up #1 ⁽²⁾	Up #3
Volume up	Up #2	Up #1	Up #3
"Old" page up	Up #1	Up #2	Left #3
"New" d-pad up	Up #1	NA	
Treo jog up	Up #2	Up #2	Up #3
Clie jog up	Normal: Up #1	Pushed: Up #2	NA

(1) except when scrolling the wine list: Up #1

(2) except when scrolling the wine list: Up #2

WineManager tested devices

WineManager should be safe for any PalmOS device, release 3.5 or higher. Nevertheless, if your device is not in the above list, be sure to backup your data before installing **WineManager**. Any compatibility report for a non-listed device will be greatly appreciated and will guarantee your device to be taken into account for further releases.

WineManager has been tested on:

- **Centro** (gsm)
- **Treo 680**
- **Treo 650** (gsm)
- **Treo 600** (gsm)
- **Treo 180** (900/1800)
- **Treo 180** (900/1900)
- **WorkPad c3**
- **Tungsten TX**
- **LifeDrive**
- **Zire 71**
- **Zire 72**
- Treo 755p simulator
- Treo 700p simulator
- Treo 650 simulator (cdma)
- Treo 600 simulator (cdma)
- Treo 270 emulator
- Tungsten C simulator
- Tungsten E simulator
- Tungsten T simulator
- Tungsten T3 simulator
- Tungsten T5 simulator
- Zire 21 simulator
- Zire 22 simulator

- Zire 31 simulator
- Garnet 5.4 simulator
- Cobalt 6.1 simulator

Chapter 6 / WineManager version history

2010-06-25: WineManager 1.3.2

2009-10-31: WineManager 1.3.1

- Updated feature: vintage charts

2009-06-26: WineManager 1.3.0

- Updated features: vintage charts, food pairing

2008-12-20: WineManager 1.2.1

- Updated feature: vintage charts

2008-10-08: WineManager 1.2.0

- Corrected issue: main list improper line selection

2008-10-01: WineManager 1.1.9

- Updated feature: vintage charts

2008-08-09: WineManager 1.1.8

- Improvement: minor "Barcode helper" changes
- Corrected issue: menu not closing properly
- Corrected issue: DIA compatible devices (Palm TX)

2008-08-03: WineManager 1.1.7

- New feature: "Barcode helper" to enter barcode values
- Corrected issue: copy/paste improvement

2008-06-28: WineManager 1.1.5

2008-04-19: WineManager 1.1.4

2008-03-07: WineManager 1.1.3

2008-01-14: WineManager 1.1.2

- Updated feature: vintage charts

2007-11-26: WineManager 1.1.1

- Updated feature: vintage charts
- Corrected issue: graphic glitch with "EAN/UPC code" text

2007-09-25: WineManager 1.1.0

- Updated feature: vintage charts
- Minor cosmetic changes

2007-08-05: WineManager 1.0.9

- Dynamic Input Area (DIA) support
- Updated feature: vintage charts

2007-06-19: WineManager 1.0.8

- Updated feature: vintage charts
- Scrolling speed improved
- Internal fixes and optimizations

2007-04-30: WineManager 1.0.7

- Fuzzy logic search now 300% faster!
- Fuzzy logic search additional ARM optimizations
- "year" not mandatory anymore (non vintage)
- Updated feature: vintage charts

2007-03-11: WineManager 1.0.6

- Major vintage charts update!
- New "On order" indicator added
- New sparkling wine indicator added
- Background color added for sweet and sparkling wines
- Improved navigators, side buttons & jogs support
- Page scrolling up/down, top/bottom jump added
- Updated for the upcoming Barcode/13 release
- Copy/paste minor issue fixed
- Minor cosmetic changes

2007-01-22: WineManager 1.0.5

- Updated feature: vintage charts
- Maximum price extended to 499.99
- Total quantity of bottles purchased added
- Page up/down to scroll vintage charts
- User interface improvements and minor fixes

2006-10-16: WineManager 1.0.4

- New "restaurant mode" feature
- Updated feature: vintage charts
- User interface improvements
- Zire 72 camera support added

2006-07-29: WineManager 1.0.2

- Autofill issue 4.1.2/11/78178 fixed

- Global find issue on older devices fixed

2006-07-28: WineManager 1.0.1

- New local and global find feature
- Improved fuzzy search feature speed
- New toggle font size feature for HiRez devices
- Improved cellar view speed for LoRez devices
- Several minor cosmetic changes
- Cobalt 6.1 support added
- Minor changes and fixes

2006-07-04: WineManager 1.0.0

- First 2005 charts now available for some appellations!
- Cellar analysis accuracy fixed
- pnoJpegLib support added
- Several GUI improvements and fixes
- Grayscales improved on PalmOS 3.5 devices
- Autofill feature fixed
- XML export format revamped
- Treo700p support added

2006-05-03: WineManager 0.9.9

- Chilean appellations added

2006-04-26: WineManager 0.9.8

- New buying suggestions for food pairings
- Improved CSV/XML exports
- Minor cosmetic fixes

2006-04-20: WineManager 0.9.7

- Details text area scrollbar added
- JPEG library's issue workaround added
- Producer's name long strings fixed
- Improved main list navigation

2006-04-08: WineManager 0.9.6

- Minor issue fixed in main list

2006-04-02: WineManager 0.9.5

- New filtering in cellar analysis

2006-03-24: WineManager 0.9.4

- Minor flavor/aroma issue fixed

2006-03-22: WineManager 0.9.3

- New parameter in cellar analysis
- Zire 71 camera support added

2006-03-01: WineManager 0.9.2

- First official public release
